Dear Juliet,

LAND OFF OAKHURST RISE, CHELTENHAM: CONSIDERATION OF GRASSLAND FOR KWS DESIGNATION

Thank you for taking the time to meet to review the grassland on site. I set out below a summary of some of the comments I raised during our meeting which may be a helpful record to assist in drafting your response to the KWS application.

Criteria

The criteria for grassland selection are unusual in that they do not relate the required species number for designation to an area. For example, it is normal to express species thresholds in terms of their cover per m2 (unless dealing with rare species). This is how the NVC works in selecting community types for example, as does the new UK Habitat Classification system. Accordingly, when assessing a potential KWS, it is necessary to apply this parameter via observation. Herb rich meadows, in terms of frequency and constancy of a range of indicator herb species in the sward, are typically of elevated value, while those which are herb poor are not. I would refer you to Appendix 2 of Aspect Ecology's Botanical Survey 2020 (copy enclosed within Technical Note TN08) of the grassland at the site, which records typical grass cover values of mostly 90 – 95% and a typical herb cover of 5 – 10%. The survey also notes that the number of species recorded per quadrat is lower than the averages for the described NVC communities, illustrating that the identified areas of grassland are relatively poor examples of their type.

Data collection

Aspect Ecology has provided a report of a systematic survey of the site which records species occurrence and presents the results in a standard manner using recognised techniques and analysis e.g. NVC and DAFOR. Accordingly, there can be high confidence attached to the data.

No such survey report has been presented by Charlton Kings Friends (CKF/FOCK) / Bioscan, but rather only a table of species on the KWS selection list at Table H5c of the Part 2 KWS criteria are put forward. There is no record of how the data have been collected, when they were collected, by what method, by who (by professional ecologists or members of the public), their qualifications and botanical experience or where the species lie on the site or their frequency. Accordingly, there can only be low confidence attached to the data.

KWS Species count

CKF report that 21 species have been recorded on the site. Of these species it is pertinent to make the following observations. Bluebell, Primrose and Barren Strawberry are likely closely associated with the hedgerows and marginal woody vegetation at the site rather than the grassland. The BSBI online Atlas of the British Flora¹ describes them as follows:

No.	Species	BSBI account of species ecology
1	Bluebell	A bulbous perennial herb occurring, sometimes abundantly, in
		a wide variety of deciduous woodlands, in hedgerows, on
		shady banks and, especially in western and upland areas, in
		meadows, under Pteridium and on cliffs. It also occurs as a
		naturalised garden escape. It is sensitive to long-term grazing.
		Generally lowland, but reaching 685 m on Craig-yr-Ysfa
		(Caerns.).
2	Barren Strawberry	A perennial herb of relatively infertile, dry but not droughted
		soils in open woods, woodland margins, scrub, grassy hedge
		banks and rock crevices; also occasionally in meadows and on
		walls. In the lowlands it is usually found in partially shaded sites
		but it extends into open habitats in upland areas. 0-790 m
		(Helvellyn, Cumberland).
3	Primrose	An evergreen, or sometimes aestivating, perennial herb typical
		of sites shaded from hot sun, found in woodland, on Nfacing
		banks, in hedgerows, coastal slopes and shaded montane
		cliffs. Reproduction is by seed, which is usually dispersed by
		ants. 0-850 m (Mt Brandon, S. Kerry).

This is also likely to be the case, albeit potentially to a lesser extent, for Common Dog Violet. The BSBI online Atlas of the British Flora describes it as follows:

No.	Species	BSBI account of species ecology
4	Common Dog Violet	This perennial herb occurs in a wide range of habitats, including open deciduous woodland, hedge banks and road verges, meadows, heaths, moorland, mountain grassland, rocky slopes and cliff ledges; it can become a serious weed in gardens. It avoids wet areas but is generally indifferent to soil type, shunning only the most acidic habitats. 0-1020 m (Stuchd an Lochain, Mid Perth).

We would also note that the Aspect Ecology survey recorded the presence of Hybrid Cinquefoil and there is the possibility that the identification of Barren Strawberry could be confused with Hybrid Cinquefoil as they are superficially similar. This could also be the case with Yellow Oat Grass (present on the CKF list) and Meadow Oat Grass (recorded by Aspect Ecology), albeit these are more readily distinguished.

Accordingly, taking into account the above observations, the CKF list of 21 species should be reduced to 17 in number.

Moreover, Aspect Ecology's Botanical Survey 2020 (copy enclosed within Technical Note TN08) recorded only 12 KWS species as present, and while some early flowering species may have been

¹ https://www.brc.ac.uk/plantatlas/

KWSs are Special

The purpose of designating Wildlife Sites is to capture habitats which are special in terms of their ecological quality. If this were not the case, low value habitats could be designated. Special meadows typically are those with a high herb content, which the public would describe as "full of flowers". In turn these provide rich pollen and nectar sources which support a range of invertebrates, with butterflies being a particularly charismatic group which the public enjoy.

The grassland at Oakhurst Rise does not support the above characteristics due to the low frequency and constancy of herbs in the sward (typically 5-10% - see Appendix 2 of Aspect Ecology's enclosed Botanical Survey 2020 survey within TN08). Accordingly, if the grassland were to be designated as a KWS, any Wildlife Trust members visiting would likely be disappointed by what they found, as the grassland does not possess these special features, it being rather ordinary in nature. This reflects the fact that MG1 is a common grassland type, with the grassland on the site representing a species poor example of its type. To designate such sites would de-value the KWS network.

In this regard, the grassland does not represent 'Priority habitat – lowland meadow' or 'unimproved grassland' as stated on the 'Gloucestershire Key Wildlife Site Assessment Sheet' submitted by CKF / Bioscan, as Priority habitat lowland meadow requires the presence of an MG5 NVC community.

Qualification as a KWS

From the above review finds, it is our view that the grassland falls short of possessing the necessary ecological interest required for qualification for KWS designation. It therefore should not be designated, as to do so would de-value the series.

Protection

No protection is afforded to KWSs and accordingly there is a risk that a change in management could result in the loss of any interest present. For example, this could include application of herbicide, fertilizer, re-seeding or other inappropriate management. Accordingly, the future of such sites is not secure, which is a key consideration for planning.

Restorability

Restoration of any grassland is possible towards a community type of increased botanical interest. However, in most cases, including at Oakhurst Rise, there is no realistic mechanism that will come forward to enable this, save for a development proposal. In addition, while the grassland may in the past have been of increased botanical interest, this has been lost a considerable time ago and the seed bank may no longer be present or viable to enable restoration, without intervention e.g. importation of seed. Soil sampling on site around trees has shown the activated zones with increased levels of desirable soil fungi, bacteria and nematodes are limited to the areas beneath tree canopies and do not extend into the grassland, which appears to also be suffering from compaction issues.

Management

At the present time, positive conservation management is not secured and inappropriate management may occur e.g. cutting of the grass and the leaving of the arisings in place. There is no realistic prospect of securing beneficial conservation management, save via a development proposal.

Development proposals

The development proposals represent an opportunity to secure the future of the grassland interest. While an area will be lost to the proposals, a substantial area (~1.9ha) will retained and enhanced. In particular the development will:

- Secure future: The future of the grassland will be secured and protected such that the risk that
 its interest would be lost through inappropriate management e.g. application of herbicide,
 fertilizer or re-seeding would be removed;
- Restoration: Positive work would be carried out to restore the grassland interest to that of a meadow of high conservation value e.g. MG5. The detail of how this would be achieved would be the subject of a specific method statement, but could include the scarification of the sward to expose the underlying seedbank and soil and the import of green hay from a suitable local donor meadow if one is available or alternatively the spreading of an appropriate native wildflower seed mix with a large Yellow Rattle component to reduce the vigour of coarse grasses;
- **Conservation management**: Favourable grassland conservation management would be secured under the proposals which would be prescribed within a formal management plan. This would then be actioned to ensure the management of the grassland is optimal to maintain the restored botanical interest;
- Long term funding: Funding to manage the meadow would be secured under the proposals.
 This would most likely arise via a service charge on properties such that an assured source of funding for conservation management of the grassland would be available for the life of the development.

The resulting meadow would be herb rich and full of colour such that local residents and Wildlife Trust members would value it. The resulting pollen and nectar sources would be considerably increased with the consequence that invertebrate interests would also increase significantly, including highly visible groups such as butterflies and moths. The grassland would be patrolled by dragonflies from the proposed pond while small mammals, reptiles, amphibians, birds and bats would be attracted to the restored meadow.

At the present time, little use of the grassland is made for educational purposes by the adjacent school. However, under the proposals, much of the enhanced grassland will remain leased to the school allowing them full access to it in the future. The botanical and faunal interests will be much more readily visible which would provide an accessible resource for nature studies / biology classes.

Elsewhere in the development, faunal enhancements will also be introduced such as in the form of the installation of enhancements targeted to specific species groups including bat boxes, bird boxes, and buried log piles; the creation of a dedicated organic material composting area in the vicinity of the new pond to provide an area suitable for Grass Snake egg laying; a proposed pond will hold water providing constant habitat for aquatic species and incorporate shallow drawn down zones, which are areas of high biodiversity potential due to seasonal changes in water level.

Summary and Conclusion

The species identified by CKF do not appear to arise from a formal survey and hence there is no record of how the data has been collected, when they were collected, by what method, by who, their qualifications and botanical experience or where the species lie or their frequency. Accordingly, there can only be low confidence in the data. The count of 21 species includes four species which are likely closely associated with the hedgerows, trees and boundary vegetation rather than within the core grassland areas. Accordingly, these should be discounted from the list such that number of relevant KWS grassland species is reduced to 17. Grassland KWSs should be special and recognisable to the public, typically because they are "full of flowers". The grassland at Oakhurst Rise does not support the above characteristics due to the low frequency and constancy of herbs in the sward (typically 5 – 10%). Accordingly, if the grassland were to be designated as a KWS, any Wildlife Trust members visiting would likely be disappointed by what they found, as the grassland does not possess these special features, it being rather ordinary in nature. The prospects for restoration of the grassland are low while similarly conservation management is not secured. As such, the grassland interests remain at risk of being lost. Accordingly, it is our view that the grassland falls short of possessing the necessary ecological interest required for qualification as a KWS designation

Nonetheless, the development proposals present an opportunity to secure the future of a substantial proportion of the grassland. This would be restored and conservation management secured for the long term. The grassland would be recognisable as special in nature by any visiting Wildlife Trust members, with the majority of the grassland secured for use by the school. Its elevated interest would mean that its botanics would be readily identifiable and accessible as a resource for nature studies / biology classes. Measures to enhance faunal interests would also be brought forward under the proposals further adding to the accessible diversity of species.

I trust the above comments are of assistance and we look forward to hearing from you.

Yours sincerely

Alistair Baxter Director

cc. Gary Kennison (Principal Ecologist, Gloucestershire County Council)

Encl. Technical Briefing Note TN08: Assessment of the Site Against Gloucestershire Local Wildlife Site Criteria

KWS Assessment

Project: Land Adjacent to Oakhurst Rise, Cheltenham

Technical Briefing Note TN08: Assessment of the Site Against Gloucestershire Local Wildlife Site Criteria

Date: 07 August 2020

1. Executive Summary

- 1.1 Aspect Ecology has carried out a review of the above site in relation to the Gloucestershire Key Wildlife Site (KWS) Selection Criteria, which have been developed by the Gloucestershire Wildlife Sites Partnership.
- 1.2 In order to potentially qualify as a KWS on the basis of grassland habitat, a site must meet at least one of nine General Criteria, such as diversity or value for learning. In addition, any site must be subject to detailed botanical survey work to identify the plant communities present (using the National Vegetation Classification NVC methodology) and identify the presence of any species listed as occurring on grasslands of high conservation concern in Gloucestershire. The site must fit one of the listed plant communities AND have above a threshold of the listed species of conservation concern in order to potentially qualify as a KWS.
- 1.3 A review of the site against the General Criteria has been carried out below, which finds that the site does not meet any of the listed criteria. This is largely due to the small size and suburban nature of the site (being surrounded on three sides by housing and on the fourth side by a school), a lack of historic management, a lack of public access and a lack of species diversity.
- 1.4 The site has been subject to detailed botanical survey work by an experienced botanist in August 2020, which finds the site is considered to have the closest affinity to NVC community MG1a, which is a grass-dominant, species-poor community typical of fields subject to infrequent management. Correspondingly, the site therefore must contain at least 20 of the listed species of conservation concern. The survey identified 12 species which therefore falls well short of the threshold of 20.
- 1.5 In summary, detailed botanical survey work coupled with a review of the General Criteria finds that that site is not of elevated value. Accordingly, in our opinion it does not meet the required criteria for designation as a KWS. Indeed, should it be designated it would serve to de-value the series as a whole through the inclusion of a non-key site.

2. Introduction

- 2.1 It is understood that the land adjacent to Oakhurst Rise, Cheltenham has been put forward by Charlton Kings Friends (CKF) as a potential Gloucestershire Key Wildlife Site (KWS), on the basis of its grassland habitat. This is set out in correspondence from Bioscan dated 29 July 2020.
- 2.2 Aspect Ecology has been commissioned to carry out a review of the potential of the site to qualify as a KWS. This review is set out below.

3. Process of Designation

3.1 The methodology for selection of KWS is set out in Part 1 of the Gloucestershire Key Wildlife Sites Handbook¹, and is summarised below.

Gloucestershire Wildlife Sites Partnership

3.2 During 1976-1977, the Gloucestershire Wildlife Trust conducted a habitat survey of the county. As part of this work, approximately 300 sites were surveyed which were identified as being of ecological significance within Gloucestershire and formed the first Key Wildlife Sites. The Gloucestershire Wildlife Sites Partnership was set up in January 2010 to oversee the Key Wildlife Sites system.

Site Selection Panel

3.3 From within the Wildlife Sites Partnership, the handbook stated in 2015 that a panel would be appointed to apply the LWS selection criteria and decide whether a candidate site should be designated as an LWS. As stated in section 1.10 of the handbook: "The operation of the Site Selection Panel is heavily dependent on the carrying out of regular KWS surveys, both of potential new sites and existing KWS."

Site Survey

- 3.4 Section 1.11 of the handbook gives guidance in relation to surveys, such as acquiring landowner permission to access the site for survey. In this regard it states: "If no permission is forthcoming, either through inability to contact the landowner or through refusal, then surveyors will not trespass on land in order to acquire data".
- 3.5 A key element in identifying a KWS is the carrying out of a detailed and robust site survey. No specific guidance is given in the handbook in relation to the requirements for experience and expertise of the surveyors, however in relation to habitats it states "Habitat survey for KWSs is based upon an extensive survey with site and habitat descriptions, a habitat map and species list.... Full National Vegetation Classification survey information may also be collected and used on occasions." Given the key importance of obtaining accurate high quality survey data in informing the KWS site selection process, survey data should therefore be collected by reputable surveyors or organisations.
- 3.6 The criteria for a grassland KWS (as described further below) state that sites may only qualify where the grassland is identified as a particular plant community type using the National Vegetation Classification (NVC) system AND supports a threshold number of particular species from a given list. Carrying out NVC surveys requires a high level of knowledge and expertise, and

1005487 TN08 Review of KWS Criteria

 $^{^{}m 1}$ GCER (July 2015) Gloucestershire Key Wildlife Sites Handbook Part 1 v4.5 Final

therefore it would be expected that a suitably robust survey would be carried out by environmental professionals with many years' experience of carrying out botanical surveys and using the NVC technique. Therefore, whilst surveys carried out by amateurs may be helpful in highlighting the potential of a site to be a KWS, should not be relied upon as an evidence base for site selection and therefore caution should be attached to any such records.

- 3.7 On completion of the survey, a report is written by the surveyor and sent to the Site Selection Panel to evaluate each site against the selection criteria, who will call in additional technical expertise where required. If the site meets the thresholds within the selection criteria it is put forward for selection as a proposed KWS.
- 3.8 Any site which is not approved would be recorded for a review at a later date, for example borderline KWS or sites with inadequate survey information (i.e. survey data has not been collected by a suitably experienced surveyor or reputable organisation).

Ratification and Notification of Landowners

3.9 Following the above, the potential KWS goes through a formal ratification process and the site is added to the KWS register.

4. Site Selection Criteria

General Criteria

- 4.1 Part 2 of the Gloucestershire Key Wildlife Sites Handbook lays outs the site selection criteria for KWS². As set out in section 2.5 of the document, all sites should fulfil at least one of the criteria in the Checklist of General Key Wildlife Site Criteria (set out in section 2.1 of the handbook part 2) which include:
 - Size or Extent;
 - Diversity;
 - Naturalness and Typicalness;
 - Rare or Exceptional Feature;
 - Fragility;
 - Recorded History or Cultural Associations;
 - Wildlife Corridors and Other Connected Habitats;
 - Value for Appreciation of Nature; and
 - Value for Learning.
- 4.2 Section 2.5 states that some habitat selection thresholds depend on lists of indicator plant species, however it is important to note that the Site Selection Panel will **NOT** select a just because it fulfils the minimum threshold of species, the site must also fulfil **at least one** of the General Criteria. It also states that: "Sites which only support habitats with features that do not meet the minimum thresholds will not be selected as KWS, unless other factors such as value for learning or nature appreciation are particularly well represented".

Grassland Habitat Criteria

4.3 Within the grassland section of the handbook (section H5 starting on page 25), there are three sub-categories:

² GCER (July 2015) Gloucestershire Key Wildlife Sites Handbook Part 2 v4.5 Final

- **H5.1.** This includes all grasslands larger than 0.5 ha which are identified as one or more of the NVC types in Table H5a (which includes community types CG3, CG4, CG5, U4, U5, MG4 and MG5) **AND** which support **15** or more species from Table H5c (which comprises a list of species occurring on grasslands of high conservation concern in Gloucestershire). **These are high priority grassland types**.
- H5.2. This includes areas of semi-natural grassland larger than 0.5 ha which are identified as
 one or more of the NVC types in Table H5b (which includes community types CG7, CG10, U1,
 MG1, MG6, MG9, MG10, MG11, MG12 and MG13) AND which support 20 or more species
 from Table H5c.
- **H5.3** All semi-natural grasslands below 0.5ha which fit the description for H5.1 or H5.2 where they occur in connection with other qualifying habitats, either as a mosaic or as an adjacent patch.
- 4.4 Table H5c sets out a list of species occurring on grassland of high conservation concern in Gloucestershire, however no indication is given in relation to the abundance at which these species might occur in the sward. It therefore takes the simplistic view that if the species is present in the sward, that it counts towards the threshold number, even if only a single specimen is present. Therefore, a grassland with extremely low frequency of the listed species may still meet the threshold, despite it being of poor quality in all other respects (e.g. being dominated by common coarse grass species with very low coverage of herbs). This constraint is overcome to a certain extent by the grassland needing to meet the threshold number of species AND fit with one of the listed NVC plan communities AND at least one of the General Criteria, but again fitting to these NVC communities does not imply that the grassland sward is species-rich, or of high ecological value.

5. Review of the Site Against the Selection Criteria

5.1 A review of the site against the LWS selection criteria has been carried out below in relation to the grassland habitat criteria and the general criteria.

Grassland Criteria

- 5.2 In order to determine whether the site meets the thresholds for a KWS under the grassland habitat criteria, an NVC survey was carried out of the site in August 2020. The survey was carried out by a an experienced botanist with over 12 years' experience in carrying out botanical and NVC surveys (the surveyors CV is provided with the full survey report in Annex 5487/1). In addition to the NVC survey, a transect was walked across the entire site to identify and record a representative list of field-layer vascular plant species within the site, along with any of the species listed in Table H5c of the KWS Handbook. The abundance of each species was estimated according to the DAFOR scale. The full results of the survey are set out in Annex 5487/1 and summarised below.
- 5.3 Three main areas of homogenous grassland vegetation were identified within the site:
 - Area A: False Oat-grass *Arrhenatherum elatius* dominant vegetation, which comprises the vast majority of the site;
 - Area B: Tor-grass *Brachypodium pinnatum* dominant vegetation, which forms small stands mainly in the north of the site;
 - Area C: Yorkshire-fog *Holcus lanatus* dominant grassland, which occupies a small part of the western portion of the site.

- 5.4 Analysis of the survey data finds that the majority of the site (Area A) is considered to have the closest affinity to NVC community MG1a, which is a grass-dominant, species-poor community typical of fields subject to infrequent management. Small areas of the grassland (Area B) are considered to represent an intermediate between MG1a and CG4c, based on the localised dominance of Tor-grass, but lack many of the calcareous species typically associated with CG4. A small part of the western portion of the site (Area C) is considered to represent a transition between MG1 and MG9, with a somewhat greater forb cover, but remains species-poor.
- 5.5 In all cases, the average number of species recorded per quadrat is lower than the averages for the described NVC communities, suggesting that the areas are relatively poor examples of their type.
- 5.6 Forb cover in the quadrats is very low at typically 5 10%. This reflects the habitat as a whole which is grass dominated at a cover which greatly exceeds the description of MG1(26a) in the UK Habitat Classification Field Key as "vegetation with over 50% grass cover".
- 5.7 A total of 12 species of local interest, according to the KWS selection criteria, were recorded within the site, which therefore falls well short of the 20 required for selection. It is understood, that records of additional KWS species are present, although these were not collected as part of systematic surveys of the site. While some early species may be present which would not have been recorded during the current survey, the absence of others being re-recorded during the current survey reflects the very small number of individuals of such species which may be present. Given that they cannot be readily re-recorded, as they are represented at such a low frequency in the sward (and they are not rare species), it follows that they contribute little to nothing to the conservation interest of the grassland. Accordingly, these species would not be expected to be recorded during snapshot surveys carried out for KWS selection. Rather, the criteria thresholds reflect numbers of indicator species which would be expected to be able to be readily recorded during KWS surveys.

General Criteria

- 5.8 A review has been carried out of the site against the General Criteria set out in Part 2 of the KWS selection criteria handbook. This is summarised below and set out in full in Annex 5487/2.
 - **Size or Extent** does not meet the criteria as it is small in size and does not contain any exceptional or large species populations.
 - **Diversity** does not meet the criteria as survey work has confirmed the site is not diverse beyond the context of the site itself.
 - Naturalness and Typicalness does not meet the criteria as it located in a suburban location
 and survey work has confirmed it does not contain a notable vegetation structure, notable
 habitats beyond the context of the site itself, a notable mosaic of habitats or support
 significant populations of notable species.
 - Rare or Exceptional Feature survey work has confirmed no rare or exceptional features are
 present;
 - **Fragility** survey work has confirmed the habitats within the site are not of importance beyond the context of the site i.e. below the county context, and therefore the criteria is not applicable to the site.
 - **Recorded History or Cultural Associations** not applicable as the site has not been subject to historic/long-term/traditional management practices.
 - Wildlife Corridors and Other Connected Habitats does not meet the criteria due to enclosure of the site by houses on three sides and a school on one side.

- Value for Appreciation of Nature does not meet the criteria as there is no public access to
 the site and views into the site from the surrounding dwellings would be distant and obscured
 by trees.
- Value for Learning the adjacent school does have access to the field although at the present time, little use of the grassland is made for educational purposes. Given the currently herb poor nature of the sward, it is considered that this would not be a resource the school would turn to for grassland botanical studies.
- 5.9 Based on the review carried out, the site does not meet any of the General Criteria.

6. Summary

- 6.1 A review has been carried out to determine whether the site may meet the identified criteria to qualify as a KWS. The review has been informed by survey work carried out at the site including habitat survey, botanical survey and faunal surveys.
- 6.2 In order to potentially qualify as a KWS, a site must meet at least one of the General Criteria set out in Part 2 of the KWS Handbook, AND, in relation to grassland sites, confirm to one of the listed NVC communities AND contain a number of listed species above a particular threshold (from a list of species occurring on grassland of highest conservation concern is Gloucestershire). Where sites may qualify on the basis of these criteria, the site is put forward to the Gloucestershire Wildlife Sites Partnership Site Selection Panel for consideration as a KWS.
- 6.3 The review finds that the site does not meet any of the nine General Criteria, whilst detailed botanical survey work carried out in August 2020 finds that the majority of the site is considered to have the closest affinity to NVC community MG1a, which is a grass-dominant, species-poor community typical of fields subject to infrequent management. Only 12 listed notable species were recorded and therefore the site falls well short of meeting the threshold of 20 species for MG1 grasslands. The botanical survey has been carried out by an experienced botanist with a detailed report presented. As set out in the KWS handbook Part 1 at paragraphs, 3.5 and 3.6, surveys not carried out by suitable experienced professionals should be considered to be unreliable, whilst as stated in paragraph 3.4, data acquired under trespass should be disregarded.
- 6.4 In conclusion, detailed botanical survey work, coupled with a review of the General Criteria finds that the site, in our opinion, does not meet the required criteria for designation as a KWS. Indeed, should it be designated it would serve to de-value the series as a whole through the inclusion of a non-key site.

Annex 5487/1 Results of August 2020 Botanical Survey Work

Botanical Survey 2020

Project: Oakhurst Rise, Cheltenham

Technical Briefing Note TN09: Results of Botanical and NVC Survey

Date: 05 August 2020

Background

 Aspect Ecology Ltd has been appointed by William Morrison to carry out a botanical and vegetation classification survey of the site at Oakhurst Rise, Cheltenham. The site is proposed for residential development and associated landscape enhancements.

Method

NVC survey

- 2. The National Vegetation Classification (NVC) survey was carried out using the methodology outlined in the NVC Users' Handbook (Rodwell 2006) on 1st August 2020. Firstly, a familiarisation exercise was undertaken to identify areas of homogenous vegetation. This exercise identified that one plant community dominated the site, but two other somewhat distinct communities were present at much smaller extents. Therefore, each of these three communities was sampled using quadrats.
- 3. There is no definitive number of quadrats required in NVC survey, although it is customary to take five quadrats from each homogenous stand of vegetation (Rodwell 2006). As the dominant community covered a large area, ten quadrats were taken across the site, while five quadrats were taken from each of the two smaller-sized communities. Therefore, 20 quadrats were recorded in total. The quadrats were placed in areas considered to be representative of the community.

- 4. Each quadrat measured 2x2 m, which is the size 'almost always' used for the original NVC sampling of mesotrophic grassland (Rodwell 1992). Within each quadrat, the percentage cover of all plant species was recorded, with Domin scores of 1-3 used where cover was less than 4%. Bryophytes were included in the NVC survey, but none were noted in the quadrats. The height of the grassland sward was recorded along with a 10-figure grid reference using a GPS smartphone app, which gave an accuracy of 7 m. The NVC survey was undertaken by an ecologist with over ten years of botanical survey experience, including of grassland communities and NVC surveys throughout the UK (see Appendix 1).
- 5. The quadrat data was analysed and interpreted using a combination of experience and the keys and community descriptions in Rodwell (1992). The data was also analysed using the Modular Analysis of Vegetation Information System software (MAVIS version 1.04). MAVIS results were interpreted with caution and used only as an aid to identification¹. The NVC quadrat data is presented at Appendix 2.

Botanical survey

6. In addition to the quadrat data, a transect was walked across the entire site comprising a series of parallel lines spaced 10 m apart, to record a representative list of field-layer vascular plant species within the site. The abundance of each species was estimated according to the DAFOR scale. Notes on the distribution of each species were made where appropriate, including for those species included in Table 5Hc of the Key Wildlife Site (KWS) selection criteria. Additional species recorded from a survey by Aspect Ecology in July 2019 were added to the list where appropriate. The species list is provided at Appendix 3.

-

¹ The limitations of NVC analysis software are described in the NVC Users' Handbook (Rodwell 2006), for example, "they are no substitute for the experience of the ecologist and should never be used alone to provide identifications. Like written keys, they are simply a guide to negotiating a way around a complex classificatory landscape and to understanding variation that, in reality, is extremely complex." (p.48)

Constraints

7. The species lists are not intended to be exhaustive but rather provide a representative list of the botanical composition of the grassland. Nevertheless, the survey covered the entire site in detail.

The survey was undertaken towards the end of the optimal period of grassland botanical survey work, and as such species which appear early in the season may not have been visible. However, the species lists are bolstered by an additional survey undertaken in July 2019, which allowed recording of early species such as Pignut *Conopodium majus*.

Results and Interpretation

Overview

- 8. The majority of the site supported a tall, coarse grassland sward with little evidence of management in this growing season, aside of grazing by Roe Deer and a group of alpacas, which appear to be usually contained within an enclosure in the south of the site but given occasional access to the wider site. Grazing pressure was generally very low, although parts of the south of the site, near the alpaca enclosure, were more moderately grazed. The alpaca enclosure itself was noted to be very heavily grazed, with patches of bare ground throughout.
- 9. Three main areas of homogenous grassland vegetation were identified within the site:
 - a. Area A: False Oat-grass *Arrhenatherum elatius* dominant vegetation, which comprises the vast majority of the site;
 - b. Area B: Tor-grass *Brachypodium pinnatum* dominant vegetation, which forms small stands mainly in the north of the site;
 - c. Area C: Yorkshire-fog *Holcus lanatus* dominant grassland, which occupies a small part of the western field.
- 10. In addition, small patches of Tufted Hair-grass *Deschampsia cespitosa* dominant vegetation were recorded, particularly in small hollows in the northern part of the western field, and along parts

- of the southern site margin. This vegetation was insufficient in extent to record quadrats, but is likely to represent the MG9 NVC community.
- 11. Each of the three main vegetation types is described in the following sections, followed by a discussion of the KWS selection criteria.

False Oat-grass vegetation (Area A)

- 12. Area A occupies the vast majority of the site, and therefore ten quadrats were taken to investigate any variability in this vegetation type across the site. The area was characterised by a dominance of False Oat-grass, which was recorded in all ten quadrats with a frequency of 35% to 95%. Other constant species included Creeping Bent *Agrostis stolonifera* and Red Fescue *Festuca rubra*, which formed a mat of vegetation below the taller grasses, and were recorded in nine and eight of the ten quadrats respectively. Yorkshire-fog and Common Sorrel *Rumex acetosa* were recorded in all ten quadrats.
- 13. Forb species were notably infrequent in the quadrats, generally occupying 5% to 10% of the coverage. Aside of Common Sorrel, the only species which occurred frequently were Meadow Vetchling Lathyrus pratensis and Bird's-foot Trefoil Lotus corniculatus, recorded in six and two of the ten quadrats, respectively.
- 14. Based on surveyor experience and following the keys in Rodwell (1992), this area is considered to have the closest affinity to MG1a Arrhenatherum elatius grassland, Festuca rubra sub-community.
 This is a grass-dominated community characterised by abundant False Oat-grass over Red Fescue.
- 15. Analysis of the quadrat data using the MAVIS software identified MG9 *Holcus lanatus-Deschampsia cespitosa* as the best matching community for this area (Table 1). Based on experience, MG9 is often returned where Yorkshire-fog is constant, but in this case is not considered to closely match the vegetation on site due to the scarcity of Tufted Hair-grass, which is very characteristic of MG9. The next highest matching sub-communities were MG1c and MG1a. MG1c is a damper community characterised by constant Meadowsweet *Fllipendula ulmaria*,

which was not recorded during the survey. Nevertheless, a similar score was returned for MG1a. The average number of species per quadrat was 9 (Table 1 and Appendix 2), compared to the average of 12 for the described sub-community (Rodwell 1992).

Tor-grass vegetation (Area B)

- 16. Area B occupies several small stands across the site, mostly occupying patches of 25 to 100 m², although two slightly larger areas were noted around quadrats 1 and 7. This vegetation is similar in structure and community composition to Area A, except that Tor-grass replaces False Oat-grass as the dominant species. Tor-grass was recorded in all five quadrats, with a frequency of between 70% and 80%, while False Oat-grass dropped in frequency with a maximum coverage of 20%. As in Area A, Creeping Bent and Red Fescue occupied the ground layer below the taller grasses, and were recorded in all five quadrats. Sweet Vernal-grass *Anthoxanthum odoratum* and Yorkshire-fog were also recorded in all five quadrats. Forb species were similar to those recorded in Area A, including constant Common Sorrel with more occasional Meadow Vetchling and Bird's-foot Trefoil.
- 17. Due to the prevalence of Tor-grass, this area has some affinity to the CG4 *Brachypodium pinnatum* community, particularly the *Holcus lanatus* sub-community (CG4c), which is a more mesotrophic example of this calcareous community. However, the area lacks some characteristic species of the community such as Sheep's Fescue *Festuca ovina*, possibly due to its small size which limits opportunities for colonisation by more calcareous species. Instead, False Oat-grass remains prevalent, recorded in four of the five quadrats, while Red Fescue was constant. These two species are more characteristic of MG1a. Therefore, the area is considered to represent an intermediate between MG1a and CG4c. Intermediates are commonly encountered in NVC survey².

_

² 'stands of vegetation intermediate in composition and structure between two (or more) NVC plant communities are commonly encountered in the field' (Rodwell 2006)

18. The MAVIS software provided unclear results for this area, with maritime cliff communities scoring highest, followed by MG9b and MG1e (Table 1), indicating the mesotrophic nature of the grassland. The species richness of quadrats averaged 9.6 (Table 1), compared to an average of 16 for CG4c (Rodwell 1992).

Yorkshire-fog vegetation (Area C)

- 19. Area C was recorded in one patch in the centre of the western field, and is characterised by a slightly shorter sward height with a reduced frequency of False Oat-grass compared to Area A. Yorkshire-fog was recorded as the dominant grass, with Sweet Vernal-grass and Creeping Bent also recorded in all five quadrats. The forb cover was somewhat higher in these quadrats, up to 15%, mostly attributable to Meadow Vetchling.
- 20. The area has some affinities with both the MG1a and MG9 communities. MG9 scored highly in the MAVIS analysis (Table 1), while the keys in Rodwell (1992) led to MG1a. Tufted Hair-grass, which is characteristic of MG9, was not recorded in any of the quadrats but was noted elsewhere. The MG4 Alopecurus pratensis-Sanguisorba officinalis community also scored highly, and although there are some affinities with this community, the area lacks the species richness and herbaceous cover typically associated with MG4, with an average of nine species per quadrat (Table 1). This area is therefore considered to represent an intermediate between MG1a and MG9.

Table 1. Summary of NVC survey results. NVC keys refer to Rodwell (1992). The MAVIS software output only includes grassland communities.

Area	Community	Outcome of NVC	MAVIS output	Species richness
	considered to have	keys		(mean average and
	closest affinity			range)
А	MG1a	MG1a	MG9b: 56.6%	9 (7-11)
			MG9: 53.3%	
			MG1c: 50.0%	
			MG1a: 49.6%	
			MG4c: 47.2%	
В	MG1a / CG4c	MG1a or CG4c	MG9b: 44.3%	9.6 (8-13)
	intermediate		MG1e: 43.5%	
			MG12a: 41.2%	

С	MG1a / MG9	MG1a	MG9: 52.6%	9 (7-11)
	intermediate		MG4c: 51.3%	
			MG9b: 50.4%	
			MG9a: 45.8%	
			MG1c: 45.8%	

Conclusion

21. The majority of the site (Area A) is considered to have the closest affinity to MG1a, which is a grass-dominant, species-poor community typical of fields subject to infrequent management. Small areas of the grassland (Area B) are considered to represent an intermediate between MG1a and CG4c, based on the localised dominance of Tor-grass, but lack many of the calcareous species typically associated with CG4. A small part of the western field (Area C) is considered to represent a transition between MG1 and MG9, with a somewhat greater forb cover, but remains species-poor. In all cases, the sward is seen to be grass dominated (mostly 90 – 95% with a low herb cover 5 – 10%) while the average number of species recorded per quadrat is lower than the averages for the described NVC communities, suggesting that the areas are relatively poor examples of the communities.

NVC communities and quadrat distribution

Appendix 5487/1:

CV of botanist: Tom Staton

Tom Staton

Principal Ecologist

Personal Profile

Tom is an Ecologist with over 12 years of experience and a MSc in Biological Recording, with an expert knowledge of the UK's habitats, flora and fauna. He has extensive experience in carrying out ecological survey work, designing and leading surveys, report writing, designing and delivering mitigation, project management, staff management and liaison with clients and stakeholders on a wide variety of projects. Tom holds Natural England licenses for bats, Dormouse, Great Crested Newt and Smooth Snake. Tom specialises in botanical survey and assessment and has excellent plant identification skills and an expert knowledge of UK habitat classification and assessment, including use of the National Vegetation Classification (NVC) survey.

Key Skills and Expertise

- Specialist in carrying out botanical survey work in all UK habitats, with particular expertise in grassland, woodland, and Open Mosaic Habitats on previously developed land.
- Extensive experience of carrying more detailed and specialist botanical survey and habitat classification, such as NVC surveys.
- Excellent plant identification skills and essential associated knowledge, such as indicator species for specific soil types, management regimes and Priority Habitats.
- Regularly analyses survey data to assess and classify habitat types (e.g. by use of MAVIS) in order to produce high quality survey reports and detailed Management Plans across a range of habitats including grassland.

Professional Memberships

 Full Member of the Chartered Institute for Ecology and Environmental Management (MCIEEM)

Qualifications / Accreditations

- PhD in Agro-ecology (in progress), Reading University
- MSc Biological Recording (Distinction)
- BSc (Hons) Biology with placement (First Class)
- CS38 Tree Climbing and Aerial Rescue

Years of Technical Experience

12 years

Project Profiles

- **Echoraise Quarry, Kent**: Carried out NVC surveys of woodland and grassland in order to classify the habitat types present within a former quarry in order to inform a plan for its restoration following additional sand and gravel extraction works. Produced a survey report, 5 year Restoration Plan appropriate to the habitats identified, and a 20 year Management Plan.
- Thames Enterprise Park, Thurrock: Carried out detailed surveys of areas of Open Mosaic Habitat in order to determine areas of greater and lesser value habitat. Designed a bespoke mitigation package to ensure an overall net gain in OMH across the 200ha development site.

- Holland Road, Hurst Green: Carried out NVC surveys of a series of grassland fields in order to classify the grassland community types present and determine their ecological value in order to inform a potential allocation of the site in the Local Plan.
- **Sheffield Motorway Service Area**: Carried out NVC surveys of woodland and grassland to inform the layout for a proposed new motorway service area.
- Snod Coppice, nr Shrewsbury: Undertook detailed survey work and prepared an ES chapter for proposed poultry sheds affecting ancient woodland. Tom led a detailed survey of the woodland, including the mapping of ancient woodland plant indicator species (1a), to inform the scheme design in consultation with the design team.
- Thames Oilport, Thurrock: Carried out botanical surveys of grassland, and classified and evaluated different areas of OMH in order to inform proposals to bring a disused diesel tank bund back into use. That habitats were located at a coastal location and adjacent to a SSSI and SAC and so a survey for notable/rare species was also carried out.
- The Grove Hotel, Chandlers Cross: Carried out a botanical survey of the ground flora of an ancient woodland to inform an assessment of feasibility to install glamping units within the woodland. The survey involved identifying and mapping ancient woodland vascular plants (as defined in the list published for the south of England) to allow any variation in the ecological quality of the woodland to be mapped to a high level of precision, to inform design constraints.
- Little Preston, Aylesford: Carried out a botanical survey of the ground flora of a woodland mapped as ancient adjacent to a quarry to inform an assessment of feasibility of development. The survey involved identifying and mapping ancient woodland indicator species, which, coupled with an assessment of the tree canopy was used to determine whether the mapped woodland was indeed ancient.

Appendix 5487/2:

NVC quadrat data

Appendix 2. NVC quadrat data. Numbers for each species refer to percentage cover (which can exceed 100% due to vegetation layering). Community reference letters refer to the descriptions in the text and are colour-coded.

Geranium dissectum Cut-leaved Cranesbill O Geranium molle Dove's-foot Cranesbill R	-			Mainly to the north and east of the in-field Oak tree,
Geranium molle Dove's-foot Cranesbill R	Geranium dissectum	Cut-leaved Cranesbill	0	
	Geranium robertianum	Herb-Robert	R	Recorded under or near tree cover

Geum urbanum	Wood Avens	О	Mainly under tree cover
Glechoma hederacea	Ground-ivy	R	Recorded under or near tree cover
Hedera helix	lvy	LF	Recorded under or near tree cover
Heracleum sphondylium	Hogweed	0	
Hieracium agg.	Hawkweed	R	Recorded near the tree belt
Hypochaeris radicata	Common Cat's-ear	О	Recorded in the northern part of the site, near field edges
Iris foetidissima	Stinking Iris	R	Single specimen noted under trees in the south-east corner of the site
Lapsana communis	Nipplewort	R	
Lathyrus pratensis	Meadow Vetchling	F	Almost ubiquitous across the site, but mostly at low frequency in the sward
Leucanthemum vulgare	Oxeye Daisy	R	Only recorded in 2019
Linaria purpurea	Purple Toadflax	R	One specimen recorded along eastern margin
Lotus corniculatus	Bird's-foot Trefoil	O-F	Recorded sporadically throughout the site
Lotus pedunculatus	Greater Bird's-foot Trefoil	o	Recorded in damper areas at SO96490 21611, SO96566 21540, and along eastern part of the southern site margin. Notably less frequent than Lotus corniculatus.
Malva moschata	Musk-mallow	R	Single specimen noted in proximity to the eastern boundary
Medicago lupulina	Black Medick	R	
Papaver somniferum	Opium Poppy	R	In the tree belt, towards the southern boundary
Plantago lanceolata	Ribwort Plantain	0	
Polygonum aviculare	Common Knotgrass	R	
Potentilla cf. x mixta	Hybrid Cinquefoil	О	Provisional identification based on vegetative characteristics. Mixture of 3 and 5 leaflets.
Quercus robur	Pedunculate Oak (seedling)	R	
Ranunculus acris	Meadow Buttercup	0	
Ranunculus bulbosus	Bulbous Buttercup	R	Single specimen noted at SO96485 21601. Could be under-recorded to some extent, but much less frequent than other <i>Ranunculus</i> species recorded.
Ranunculus repens	Creeping Buttercup	0	
Rubus fruticosus agg.	Bramble	LF	Around tree cover with minor encroachment into the fields
Rumex acetosa	Common Sorrel	F	
Rumex conglomeratus	Clustered Dock	0	
Rumex obtusifolius	Broadleaved Dock	R	
Sonchus asper	Prickly Sow-thistle	R	One specimen recorded along eastern margin
Stachys sylvatica	Hedge Woundwort	R	Recorded near tree cover
Tanacetum parthenium	Feverfew	R	In the tree belt, towards the southern boundary
Taraxacum agg.	Dandelion	R	
Tragopogon pratensis	Goat's-beard	R	Recorded in two locations: SO96621 21610 and SO96574 21571
Trifolium pratense	Red Clover	R	
Trifolium repens	White Clover	R	
Urtica dioica	Common Nettle	0	Mainly recorded at field margins
Veronica chamaedrys	Germander Speedwell	R	
Vicia hirsuta	Hairy Tare	R	Only recorded in 2019
Vicia sativa	Common Vetch	0	Only recorded in 2019
Vicia sepium	Bush Vetch	0	
Vicia tetrasperma	Smooth Tare	R	Only recorded in 2019

Annex 5487/2 Review of the Site Against the General Criteria

General	Criteria Checklist (from KWS handbook Part 2)	Review of Site against the criteria
Criteria		
Category		
Size or Extent	a. The site is an exceptionally large area of an important natural or semi-	The site is small in size at approx. 3.9ha and is set in a suburban environment surrounded
	natural habitat e.g. the largest in the county, or the largest within a distinct	by residential properties and a school. It therefore does not comprise an exceptionally
	region of the county	large area (such as the largest in the county or distinct region of the county), whilst survey work has also confirmed it does not comprise important natural or semi-natural habitat.
	b. The site supports an exceptionally large and/or thriving population of an	
	important species (as defined in the Species Criteria)	The survey work carried out at the site has included a full suite of botanical and faunal
	a. The site supports a high properties of the total group of an important	surveys and these have not recorded any "large or thriving populations of important
	c. The site supports a high proportion of the total area of an important habitat or the total numbers of an important species in the county and/or in	species", and would therefore not meet the criteria under point b. Correspondingly, the site would therefore also not qualify under point c.
	a wider national or international context	site would therefore also not qualify under point c.
		Accordingly, the site is not considered to meet the criteria to qualify under this general
		category.
Diversity	a. The site contains many of the typical species and assemblages - including	The site comprises a semi-improved grassland field partially separated by a hedgerow with
	stages of succession, subtypes and variations - for which a habitat type is	trees. A hedgerow with trees is present on the western boundary and a small number of
	considered important	isolated hedgerows are present on the other boundaries. Small areas of scrub are present
	b. The site contains the majority of species typical of the habitat as it is found	and a pond is present on the northern boundary of the site. Survey work has confirmed the grassland is not notable or diverse, either in terms of its species richness or structural
	in the county in its most favourable condition	diversity (such as having a variety of different sward lengths, tussocky areas etc.).
	in the county in its most juvour usic condition	artersity (such as harming a variety of american small rengans) tassoon, areas every.
	c. The site contains a range of semi-natural habitats in close proximity	Accordingly, the site is not considered to meet the criteria to qualify under this general
		category.
	d. A range of successional stages of habitat development are present on the	
	site	
	e. The habitats present exhibit a wide range of natural structural diversity	
Naturalness and	a. Compared with other examples in the county, the habitat present is	The site is located in a suburban location and survey work has confirmed it does not contain
Typicalness	notable for its lack of human disturbance, introduced plant or animal species,	a notable vegetation structure, notable habitats beyond the context of the site itself, a
	mechanical damage, litter, agricultural spray drift or other factors which	notable mosaic of habitats or support significant populations of notable species.
	could adversely affect the vegetation structure and/or species composition	
	of the community	The KWS Handbook notes that in relation to this category, site protection is more likely to
		be considered a priority if the habitats involved are considered to be unusually pristine
		examples, exceptionally diverse, a recognised locally distinctive type, or impossible to

	b. The site is an excellent representative of a habitat or species population that forms a distinctive element of Gloucestershire's biodiversity	restore once degraded or lost. None of these points would be applicable to the habitats recorded within the site during the survey work.
	c. The site represents an excellent example of a mosaic of associated habitats typical of Gloucestershire, e.g. floodplain grazing marsh, traditional orchards, species-rich hedgerows	Accordingly, the site is not considered to meet the criteria to qualify under this general category.
Rare or Exceptional Feature	a. The habitats and/or species present are rare, either in an international, national or county context	Survey work has confirmed that none of these points would be applicable to the site.
	b. The site is the only example of a particular habitat sub-type or variation that cannot be protected elsewhere in the county	
	c. the scientific interest of the site is dependent on a rare or unique combination of site-related factors such as geology, aspect, soil type, microclimate, hydrology or altitude Consequently, if the site was damaged or destroyed, the habitat and species communities present would be irreplaceable to the county d. the site supports habitats or species which are on the very edge of their natural range	
Fragility	a. The habitats and/or species present are fragile or vulnerable to loss, damage or exploitation, either in an international, national or county context	Survey work has confirmed the habitats within the site are not of importance beyond the context of the site i.e. below the county context, and therefore the fragility criteria is not applicable to the site.
Recorded History or Cultural Associations	a. The nature conservation interest of the site is dependent on a rare or unique combination of historical factors such as long-term land use and management patterns	It is not considered any of these points are of relevance to the site, as it has not been subject to historic/long-term/traditional management practices.
	b. the habitats and species present have become established over a very long period of time and consequently represent a limited resource in the county, as they could not be replaced or substituted	
	c. The site is a particularly good example of the positive influence of long- established cultural practice on biodiversity	
	d. the site in question has exceptional potential for education and/or public appreciation of nature due to its longstanding recorded history	

Wildlife Corridors and Other Connected Habitat	 a. The site forms part of an important, larger ecological unit which would be reduced in value as a whole if the site was damaged or destroyed b. The site forms a vital part of a sequence of habitats all of which are required in order to conserve a key population of an important species (e.g. semi-aquatic invertebrates) c. The site contributes significantly to a landscape-scale "corridor" of habitat(s) to enable species to adapt/move in response to climate change 	The site is located in a suburban setting and is surrounded on three sides by residential development. It therefore does not contribute to any form of wider landscape corridor, or function as part of a larger ecological unit. The north-south hedgerows with trees within the site form the northern portion of longer linear features which extend off-site to the south and run through the school. Beyond the school to the south is further residential development, and therefore even when taken together, these linear features do not connect with the wider landscape and are therefore isolated in nature. Accordingly, the site is not considered to meet the criteria to qualify under this general category.
Value for Appreciation of Nature	 a. Three or more of the following factors apply: The site is adjacent to, or overlooked by, a residential area There are well-used footpaths/cycleways/bridleways providing access to the site (official or permissive) The site and its features of interest are accessible to people who are physically disabled There is space to park at, or within easy walking distance of, the site There is a local 'friends' type group concerned with beneficial conservation management on the site The site is used by community groups b. There is a well-established history of community involvement with positive nature conservation management of the site 	The site is surrounded on three sides by residential properties, with the site beyond the rear gardens and therefore some distance from the houses. There may be some views of the site from residential properties, albeit these may be distant and/or obscured by trees. The site does not meet any other criteria in point a, or for point b. There are no Public Rights of Way (PRoW) running around or through the site and therefore it is not accessible to the public at all. Accordingly, the site is not considered to meet the criteria to qualify under this general category.
Value for Learning	a. The site provides the best or only Gloucestershire example of a situation where a threatened or declining habitat or species of high nature conservation interest for which there is a research need may effectively be studied b. The site has one or more features of nature conservation importance that would not ordinarily qualify for KWS or SSSI selection, but which are known to be declining or having to adapt due to factors which cannot be prevented, and for which research over the medium or long term is crucial for the success of conservation efforts elsewhere	Based on the survey work carried out, no features are present within the site which could be regarded as having any research need / need for further study which might benefit other habitats or features in the County. The southern boundary of the site is located adjacent to St Edward's Preparatory School. The school does have access to the field although at the present time, little use of the grassland is made for educational purposes. Given the currently herb poor nature of the sward, it is considered that this would not be a resource the school would turn to for grassland botanical studies.

c. The site is exceptionally well-placed to offer educational opportunities either by its proximity to a school or other place of learning, or its easy accessibility for study of the species and habitats present without causing unacceptable damage or disturbance

Accordingly, the site is considered unlikely to meet the criteria to qualify under this general category.
